## Summary Update - Resident Feedback on the Lighting Design Framework

Thank you to all residents who provided feedback on the Lighting Design Framework for Golden Lane Estate. The design team has carefully reviewed all comments received, and a number of clarifications and updates have been made to the Framework in response.

Key areas addressed include:

- **Use of Sensor-Controlled Lighting:** Lighting will be dimmable, not abrupt, with sensitivity settings reviewed post-installation to ensure resident comfort.
- **Wall-Mounted Floodlights and Tree Uplighting:** These will be used sparingly, with discreet, high-quality fittings and precise light control to minimise glare and light spill.
- **Energy Efficiency and Billing:** Control gear will be designed to support building-specific metering and fair billing.
- **Respecting Privacy and Heritage:** The strategy seeks to reduce light pollution, protect residential privacy, and honour the estate's original 1950s design ethos.
- **Crescent House Considerations:** Feedback specific to Crescent House has been acknowledged and will be addressed through a separate but coordinated lighting design process. A mock-up phase is planned, and further design detailing is underway.
- **Additional Suggestions:** Comments on corridor lighting, planter integration, and safety lighting are being reviewed as part of the next design phase.

The updated *Lighting Design Framework* reflects these refinements and will guide the interim and long-term lighting improvements across the estate. Residents will continue to be engaged as design progresses and trial installations begin.
